# osTicket Page Maintenance Notes

# General osTicket Server Administration Notes

## Server Layout

osTicket is currently running via Apache located at `/var/www/html/` with the database located in a docker container running MariaDB called "osticket\_db".

The apache config file is located at `/etc/apache2/sites-available/000-default.conf` deriving from the base apache config. While configuring the site, I attempted to assign the site location to somewhere other than `/var/www/html`, but I am not very skilled with Apache and couldn't get it working properly.

# osTicket Administration Tasks

# Creating a New Agent User

## Introduction

User management using an external backend (we use Keycloak at the time of writing) works differently in osTicket compared to other common OIDC-implemented applications.

While common OIDC implementations used role-based authentication to determine a user's access level which automatically assigns permissions depending on their role, the osTicket OpenID plugin requires the administrator to add the user manually.

However, a manually created user in this application can still be linked to a user in Keycloak. Users are identified by osTicket from OIDC via email. Therefore, if Keycloak happens to be down, then an agent can still log in using their email and a separate password set specifically for osTicket.

## How to Create an Agent User

### Obtaining Prior Information

In order to create a support agent, you will need:

- The user's email used in Keycloak
- The user's username (optional, but keeps things consistent)

### Navigate to the User Creation Page

In order to create a user, you must have the account permission to do so.

First, navigate to the osTicket Admin Page. This can be done by:

- Navigate to <https://support.fireantllcaz.net/scp> and log into your account.
- Click on `Admin Panel` at the top-right of the page. If you see `Agent Panel` instead, then you do not have permission to view the admin panel.
- Click on the `Agents` tab.
- Click on `Add New Agent`.

# Creating a User

Filling out the form should be pretty straightforward.

1. Fill out the user's first and last name.
2. Enter the email address obtained from Keycloak.
3. Fill out the user's username.
4. Set the `Authenticaiton Backend` to `Fireant LLC`.
5. Fill out additional entries as necessary.
6. Switch to the Access tab and select the Primary Department for the user. If unsure, assign the user to `Support` with `All Access`.
7. Switch to the Permissions tab and choose the permissions you would like to assign the user with.
8. Click `Create`.

Once that's done, make sure the user is able to log in at <https://support.fireantllcaz.net/scp>.
